

Semana 3 - Desarrollo Backend III (PBY2203)

Evidencia de Ejecución – Migración Datos XYZ Bank

Alumnos:

- Gustavo Domínguez
- Alonso Basualdo

Entregables

1. Ejecución: Reporte de transacciones diarias (dailyTransactions.job)

A continuación evidenciamos la orquestación del proceso batch sobre el CSV de data/semana_3/transacciones.csv, con escalado mediante ThreadPoolTaskExecutor (batch-worker-* procesando chunks en paralelo). La política de tolerancia a fallos (DomainSkipPolicy + LoggingSkipListener) aísla registros inválidos sin abortar el job: montos vacíos o no positivos, fechas inválidas y tipos fuera del catálogo cerrado (debito/credito; p. ej. invalid, desconocido). Los ítems válidos con monto > 2000 se escriben con la anomalía HIGH_AMOUNT. Al finalizar, el step y el job quedan en COMPLETED, con métricas de read / write / skip coherentes con el ruido del archivo procesado.

```

2. Ejecución: Calculo de Intereses Mensuales (monthlyInterestsJob)

Ahora evidenciamos el procesamiento de data/semana_3/intereses.csv bajo escalado multihilo (batch-worker-1/2/3). El ItemProcessor aplica las validaciones de dominio y el catálogo cerrado de tipo (ahorro, prestamo/préstamo, hipoteca); valores sentinel como -1 o unknown, así como edades/saldos vacíos o fuera de rango, se omiten con DomainSkipPolicy sin abortar el job. Además se deduplica por cuenta_id en el mismo run (solo la primera fila válida de cada cuenta se escribe). Las métricas del step (read $\approx$ 1000, write $\approx$ 50, skip $\approx$ 950) y el estado COMPLETED confirman una ejecución estable.

3. Ejecución: Estados de cuenta anuales (AnnualGenerationJob)

Con la ejecución de este job evidenciamos el procesamiento concurrente de data/semana_3/cuentas_anuales.csv con batch-worker-1/2/3. El ItemProcessor aplica el catálogo cerrado de movimiento (deposito/depósito, retiro, compra; p. ej. pago se omite) y reglas como depósito con monto 0 o campos inválidos; DomainSkipPolicy + LoggingSkipListener aíslan esos registros sin abortar el job. Los movimientos válidos se acumulan en el writer y se consolidan por cuenta_id al cerrar el step (una fila de auditoría por cuenta, no una por línea del CSV). Las métricas del step (read ≈ 1000, write ≈ 903, skip ≈ 97) y el estado COMPLETED confirman la consolidación estable bajo el volumen y ruido de los registros analizados.

```

Las consultas a MySQL evidencian la persistencia final de los tres jobs sobre la data objetivo. El ledger migration_executions registra SUCCESS con volúmenes coherentes al ruido del dataset (diario ≈ 387 write / 613 skip; mensual ≈ 50 write / 950 skip; anual ≈ 903 write / 97 skip). Las tablas de negocio confirman el resultado consolidado: ~387 reportes diarios, 50 saldos con interés (una fila por cuenta_id válida) y una fila de auditoría anual por cuenta. La exclusión controlada de registros anómalos (tipos sentinel, montos/fechas inválidos, duplicados) protege la integridad sin pérdida ni cruce de datos bajo el procesamiento multihilo.
